

Use LegendView to Change Layer Order

DID YOU KNOW . . . you can change the order of layers by dragging them in LegendView?

What Using LegendView to Change Layer Order Gives You

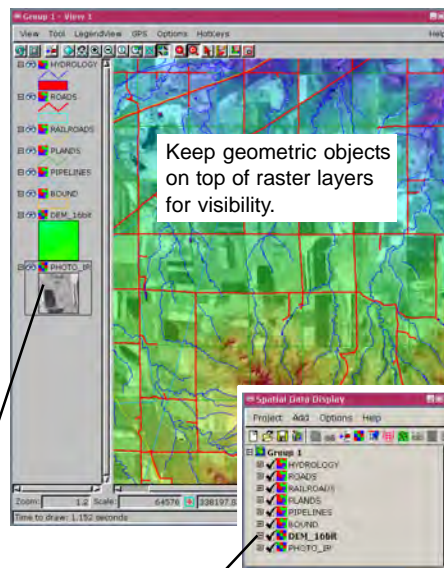

- Use mouse to drag layers up or down to change order of your layers
- Interactively drag layers to any position in layer order
- Display geometric objects on top of raster objects for full visibility

① Display of layers hiding vectors and an elevation raster object (DEM_16bit).

In the LegendView, select a layer and drag it up or down using your mouse.

② Full visibility of layers when order has been changed.

Raster object was dragged to the bottom of the layers, which allows elevation raster and vector objects to be seen.

The elevation raster (DEM_16-bit) is set to be 60% transparent so the bottom raster layer can also be seen.

How to Use LegendView to Change Layer Order

- Display layers in 2D or 3D Group windows.
- On the LegendView select and drag one of the layers up or down.

Note: You can also change layer order if you

- Right-click on a layer in the Spatial Data Display window and choose To Top, Raise, Lower, or To Bottom.
