

# Change Quick Snapshot Properties

**DID YOU KNOW** . . . you can easily change your initial settings when using the Quick Snapshot feature?

## What Changing Quick Snapshot Properties Gives You

- Select from a variety of external or internal formats
- Set a prefix to be used as file or folder name
- Save georeference files (\*.kml, \*.prj, and world files) with external formats
- Create a subfolder to save the set of snapshot and georeference files generated
- Launch Google Earth automatically if a KML file is generated

Quick Snapshot icon

The first time you click on the Quick Snapshot icon, you are prompted to select a folder (existing or new) and format in which to save the current and subsequent snapshots. These settings are retained unless you change them in the View Options window.

The Options window opens when you select Options/View Options from the Display Manager menu.

The Quick-Save Prefix button lets you change the prefix used as file or folder name, which is appended by an increasing number.

When this button is toggled on, rasters saved to external formats are georeferenced by the accompanying, same-named \*.kml, \*.prj, and world files.

Toggling on this button lets you launch Google Earth automatically if a KML file is generated.

The Format menu lets you choose from internal and external formats with different compression methods.

The Quick-Save Folder button lets you set the folder in which to save the current and subsequent snapshots.

If this button is toggled on, a subfolder is created to contain the set of snapshot and georeference files generated by Quick Snapshot.

## How to Change Quick Snapshot Properties

- Select Options/View Options from the Display Manager menu.
- Click on the Snapshot tab in the Options window that opens.
- Change the settings as desired.
