

Zoom With Locator

DID YOU KNOW . . . you can use the Locator to zoom in/out in any View window and move the area viewed around when zoomed in?

What Zooming With Locator Gives You

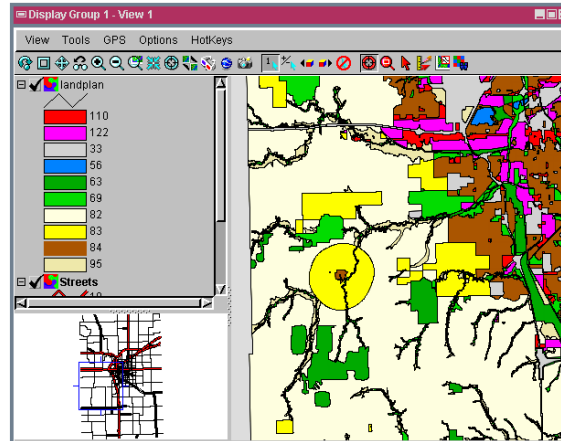

- A reference view in full extents showing the zoom area
- An elastic box defining the extents of the view(s)
- Ability to resize, and reposition the elastic box using the mouse
- Control layer visibility for the reference view

The cursor is a double-headed arrow when the mouse is over the corner/edge of the elastic box.

The cursor is hand-shaped when the mouse is over the elastic box.

The elastic box can be resized and repositioned to change what is shown in the View window to match the new extents and position of the box.

How to Zoom With Locator

- Display any group or layout and make sure Show Legend and Show Locator buttons are toggled on in the Options menu of the View window.
- Right-click on the Show/Hide checkbox for the layer in the Legend or the Display Manager to change individual layer visibility (all layers are visible by default).
- Position the cursor on any corner of the elastic box to get the double-headed arrow cursor; click and hold the left mouse button.
- Drag the corner of the box in the desired direction and release the mouse when the box reaches the desired size.
- Position the cursor on the elastic box to get the hand-shaped cursor.
- Click and hold the left mouse button.
- Drag the box in the desired direction and release the mouse when the box is in the desired position.
