

Data Logger - Editing Records

Edit Existing Records by placing the crosshair over a point in the Data Logger window and clicking the right mouse button (command-click on a Mac). The APPLIDAT opens the record for that point. Edit field values and drag the crosshair to change the record's coordinate values.

Record locations appear as colored symbols. The symbol color corresponds with the color of the table's icon button in the icon menu bar.

Place the crosshair over a point symbol and click the right mouse button to open its record for editing.

Your custom APPLIDAT can include a number of special features that make it easier for your field teams to understand and learn. You can quickly create a file of the latest instructions and program changes.

The instruction file for your APPLIDAT is easy to create and maintain, because you can use any editor that supports the HTML format. Thus you can write up the latest instruction information in a program such as Microsoft Word and use its Save As... feature to save the file in HTML format. To associate your new help file with the APPLIDAT, edit your APPLIDAT script in the SML script editor in TNTmips and select Add Text Objects from the File menu. When you select your HTML file, TNTmips copies it as a subobject under the SML script.

Instruction files won't become separated from the APPLIDAT because they are bundled together with all the other APPLIDAT resources: a team never gets to the field only to discover that some file or piece of data is missing.
